
Figure A: Performance of five T2I models across instruction following benchmarks (GenEval, DPG, R2I-Bench, SpatialGenEval) and VIOLIN(ours). All metrics are normalized to [0,1], with Color Precision and Color Purity inverted such that higher scores represent superior performance. Our curve is plotted based on the average of color precision and color purity. **The curves in the graph shows that performance on our benchmark and others are relatively consistent, which demonstrates that the capabilities measured by our benchmark are consistent with those of other benchmarks.**
